RAIDR - Single Player Phase 2

Product & Technical Confirmation Proposal - prepared for client review before development

Objective Expand Single Player into a competitive territory system with permanent ownership, snatching, guards, B2B prizes, Empire/VIP access, AI campaign creation and user-controlled notifications.	**Confirmation Purpose** This document describes our current understanding of the Phase 2 rules. Please correct any rule or flow that should work differently before implementation.

1. Zone Types & Ownership

Normal Raid Zone	Created and managed by Super Admin. Supports the normal RAIDR economy/rewards such as passive Coins and configured rewards.
B2B Raid Zone	Created by a Merchant with location, branding, hold duration and prize. It remains Pending until Super Admin approval. Rewards may include vouchers/deals, physical prizes or configured cash rewards.

2. Capture, Permanent Ownership & Snatching

Capture: A player physically enters the GPS radius and completes the Hold-to-Capture timer. The server provides the applicable capture duration. Leaving the permitted radius or abandoning the capture should cancel/reset the attempt.

Permanent ownership: Once captured, the zone remains owned by that player until another player successfully snatches it. The initial shield is only an attack-protection period; when it expires the player still owns the zone, but it becomes attackable.

Time becomes defense: Every 24 hours of continuous ownership adds **+10 seconds** to an attacker's required capture time. There is no daily physical recharge/check-in in the confirmed Phase 2 flow.

Attack Time	Base Capture Time + Ownership-Age Defense + Guard Penalty

3. Guards & Coin Battle

Players purchase Guards from the RAIDR Store using Coins, keep them in inventory and assign them to zones they own. The confirmed starting limit is **5 Guards per zone**, with **+30 seconds per Guard**. Both values must be configurable by Admin. An attacker may either wait the full additional capture time or spend Coins to eliminate Guards and reduce the timer. This is a time-and-coins defense mechanic, not an army-vs-army battle.

4. B2B Hold-to-Win, Rivalry & Empire

Hold-to-Win	Merchant defines a continuous hold requirement, for example 24, 48 or 72 hours. Passive continuous ownership is enough; no daily check-in is required.
Winning	If the player keeps ownership for the full configured duration, the campaign requirement is completed and the configured reward becomes available for redemption/claim.
Streak Broken	If another player successfully snatches the B2B zone before completion, the current owner's streak ends and the new owner's streak begins.
Rivalry Alerts	At configured milestones such as 24h or 48h, nearby players can receive push notifications encouraging them to visit the business and break the current owner's streak.
Empire / VIP	The number of zones a player currently owns determines Empire status. Admin can configure thresholds for VIP B2B access and reward multipliers; for example, a VIP campaign may require 5 currently owned zones.

5. Merchant & AI Campaign Creation

Merchant flow: Merchant Dashboard -> Create B2B Raid Zone -> configure location/radius, brand assets, hold duration, prize and eligibility -> Submit -> Pending -> Super Admin review -> Approved -> Live on the map.

AI Text-to-Campaign: Both Admin and Merchant interfaces will support prompt-based campaign creation. AI converts a plain-language request into a campaign draft (location, rules, reward and brand configuration). The result is reviewed/edited before it follows the normal approval/publish flow; AI does not directly publish a live merchant campaign.

6. Notification Preference System

RAIDR will add in-app notification preferences so users do not need to disable every notification at operating-system level. A master switch can control all notifications, while individual categories can be enabled or disabled independently.

• Daily Drop reminders	• Rare Drop alerts
• Raid Zone / shield notifications	• Zone attack / snatch alerts
• B2B rivalry & nearby opportunity alerts	• Rewards & voucher notifications
• Events / Coin Rush notifications	• Promotional / sponsored notifications

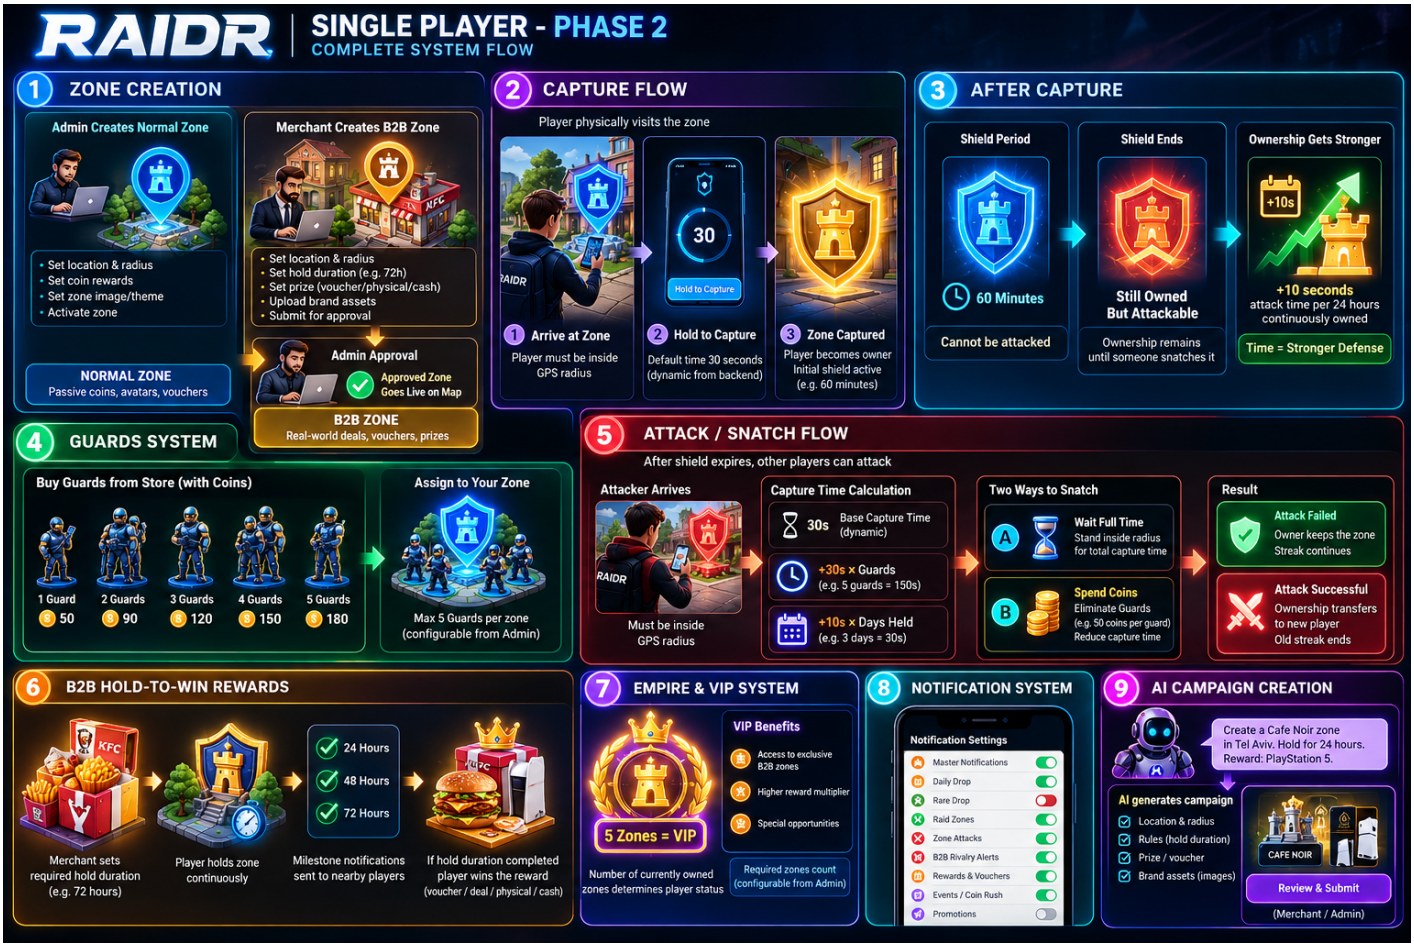

7. Dynamic Admin Configuration

Important gameplay values should be backend/Admin controlled rather than hardcoded in the mobile app. This includes: base capture/shield values where applicable, maximum Guards per zone, seconds added per Guard, ownership-age defense (+seconds per 24h), Guard coin-elimination cost, Empire/VIP thresholds, B2B hold durations, rivalry notification milestones, rewards and campaign availability/configuration.

CLIENT CONFIRMATION
This proposal represents our understanding of RAIDR Single Player Phase 2. Please review the rules and flows. If anything should behave differently, please correct us before development begins. Approval of this document will be used as the functional direction for detailed technical architecture and implementation.

Phase 2 - Complete System Flow

Visual summary of the proposed Single Player Phase 2 flow for quick review and confirmation.

Note: Any example values shown in the visual (including store pricing) are illustrative unless explicitly confirmed above. Final configurable values will be controlled through the backend/Admin configuration.
